A report on my experience.

This project was very interesting and varied, particularly for me. It revealed a lot of additional, useful information, which, as I already realize, will help me to carry out my next project.

I am convinced that constant practice brings results. The functions are more and more clearly understood and the relationship between them is clearer. The structure and programming language are becoming clearer and clearer. But I also realize that there is still a lot to learn.

Behind each new concept there is an unexplored area.

In this project I had several questions and moments of misunderstanding, which, fortunately, I was able to sort out and apply correctly.

So, the first question was about changing the background. The proposed system did not work. Replacing just one letter and the program worked.

Then there was a question about changing the length of the arrow. It was also solved by changing variable names. In general, the computer and I find a common language more and more often.

Also, when there were questions about replacing information in the functions, I made notes for myself, which helped me understand the principles and clearly explained the patterns.

I took into account the fact that in my previous work I made mistakes due to inattentive inputting of information, and this time it was not an obstacle in the design of the work.

And, as well as the previous works, there is a desire to add their graphics and movements in this program.

This is a great new experience for me. Great practice. Motivation. I want more information
